Conservation Biology for All

- Navjot S. Sodhi 2010-01-08

Conservation Biology for All provides cutting-edge but basic conservation science to a global readership. A series of authoritative chapters have been written by the top names in conservation biology with the principal aim of disseminating cutting-edge conservation knowledge as widely as possible. Important topics such as balancing conversion and human needs, climate change, conservation planning, designing and analyzing conservation research, ecosystem services, endangered species management, extinctions, fire, habitat loss, and invasive species are covered. Numerous textboxes describing additional relevant material or case studies are also included. The

global biodiversity crisis is now unstoppable; what can be saved in the developing world will require an educated constituency in both the developing and developed world. Habitat loss is particularly acute in developing countries, which is of special concern because it tends to be these locations where the greatest species diversity and richest centres of endemism are to be found. Sadly, developing world conservation scientists have found it difficult to access an authoritative textbook, which is particularly ironic since it is these countries where the potential benefits of knowledge application are greatest. There is now an urgent need to educate the next generation of scientists in developing countries, so that they are in a better position to protect their natural resources.

Phylogenetic Networks - Daniel H. Huson 2010-12-02

The evolutionary history of species is traditionally represented using a rooted phylogenetic tree. However, when reticulate events such as hybridization, horizontal gene transfer or recombination are believed to be involved, phylogenetic networks that can

accommodate non-treelike evolution have an important role to play. This book provides the first interdisciplinary overview of phylogenetic networks. Beginning with a concise introduction to both phylogenetic trees and phylogenetic networks, the fundamental concepts and results are then presented for both rooted and unrooted phylogenetic networks. Current approaches and algorithms available for computing phylogenetic networks from different types of datasets are then discussed, accompanied by examples of their application to real biological datasets. The book also summarises the algorithms used for drawing phylogenetic networks, along with the existing software for their computation and evaluation. All datasets, examples and other additional information and links are available from the book's companion website at www.phylogenetic-networks.org.

Catalogue of the Cicadoidea (Hemiptera: Auchenorrhyncha)

- Allen F. Sanborn 2013-10-31
This is the third in a series of catalogs and bibliographies of the Cicadoidea covering 1981-2010. The work summarizes the cicada literature, providing a means for easy access to information previously published on a particular species or to allow researchers the ability to locate

similar work that has been published on other species. A total of 2,591 references are included in the bibliography. The book is a source of biological and systematic information that could be used by zoologists, entomologists, individuals interested in crop protection, and students studying entomology as well as anyone interested in cicadas or who require specific information on the insects. Each genus/species is identified with the reference, the page number, any figures (if applicable), the topics covered by the reference, any synonymies, and any biogeographic information mentioned for the species in the individual reference. An added benefit to the catalog is that it is the first complete species list for the Cicadoidea, including all synonymies and new combinations through 2012. Provides nearly four times the number of references of the previous catalog, demonstrating the explosion of data since that time. Contains all references found that

mention a genus or species name in the work Includes more than 300 additional references that were not in the two previous works on this subject Features the first complete species list for the Cicadoidea, including all synonymies

**A Case of Exploding
Mangoes** - Mohammed Hanif
2010-10-29

Teasing, provocative, and very funny, Mohammed Hanif's debut novel takes one of the subcontinent's enduring mysteries and out if it spins a tale as rich and colourful as a beggar's dream. Why did a Hercules C130, the world's sturdiest plane, carrying Pakistan's military dictator General Zia ul Haq, go down on 17 August, 1988? Was it because of: 1. Mechanical failure 2. Human error 3. The CIA's impatience 4. A blind woman's curse 5. Generals not happy with their pension plans 6. The mango season Or could it be your narrator, Ali Shigri? Here are the facts: • A military dictator reads the Quran every morning as if it was his daily horoscope. • Under Officer Ali Shigri carries a deadly message on the tip of his sword. • His friend Obaid answers all life's questions

with a splash of eau de cologne and a quote from Rilke. • A crow has crossed the Pakistani border illegally. As young Shigri moves from a mosque hall to his military barracks before ending up in a Mughal dungeon, there are questions

that haunt him: What does it mean to betray someone and still love them? How many names does Allah really have? Who killed his father, Colonel Shigri? Who will kill his killers? And where the hell has Obaid disappeared to?
